## 8.5 Skill Practice

2. A trapezoid has one pair of parallel sides and at most one pair of congruent opposite sides. A kite has two pairs of consecutive congruent sides and opposite sides are not congruent.
3. trapezoid
4. not a trapezoid
5. not a trapezoid
6. trapezoid
7.  $130^\circ$ ,  $50^\circ$ ,  $130^\circ$
8.  $80^\circ$ ,  $100^\circ$ ,  $80^\circ$
9.  $118^\circ$ ,  $62^\circ$ ,  $62^\circ$
10. Trapezoid; since both pairs of base angles are congruent, they must also be supplementary, because the sum of the measures of the angles of a quadrilateral is  $360^\circ$ , making  $\overline{AB} \parallel \overline{DC}$ .
11. Trapezoid;  $\overline{EF} \parallel \overline{HG}$  since they are both perpendicular to  $\overline{EH}$ .

12. Trapezoid;  $\overline{JK} \parallel \overline{ML}$

13. 14                      14. 23

15. 66.5                      16. D

17. Only one pair of opposite angles in a kite is congruent. In this case  $m\angle B = m\angle D = 120^\circ$ ;  $m\angle A + m\angle B + m\angle C + m\angle D = 360^\circ$ ,  $m\angle A + 120^\circ + 50^\circ + 120^\circ = 360^\circ$ , so  $m\angle A = 70^\circ$ .

18.  $110^\circ$                       19.  $80^\circ$                       20.  $60^\circ$

21.  $WX = XY = 3\sqrt{2}$ ,  
 $YZ = ZW = \sqrt{34}$

22.  $WX = WZ = 2\sqrt{13}$ ,  
 $XY = YZ = 6\sqrt{5}$

23.  $XY = YZ = 5\sqrt{5}$ ,  
 $WX = WZ = \sqrt{461}$

24.  $DC = 2MN - AB$  since

$$MN = \frac{AB + DC}{2};$$

$$DC = 2(8) - 14, DC = 2$$

25. 2                      26. 3                      27. 2.3

28.

$MP = 6\sqrt{2}$ ,  $NQ = 2\sqrt{13}$ ;  $MNPQ$  is not isosceles; Theorem 8.16.

29.

57

30. 12, 36

31. A

32. 6, 8; 50; solve the equation

$$\frac{x^2 + 36}{2} = 7x - 6, \text{ the solution}$$

$x = 6$  must be rejected because the midsegment will equal 36 and that is not possible.

33. *Sample answer:* A kite or a quadrilateral that is not a parallelogram or a trapezoid would have no pair of opposite sides parallel. So, no consecutive angles would be supplementary. So, the measure of an interior angle could be greater than  $180^\circ$ .

## 8.5 Problem Solving

34. 32.2 cm, 68.8 cm

35. *Sample:*

36. a. isosceles trapezoid, kite

- b. It increases;  $m\angle BAF$  approaches  $180^\circ$ ,  $m\angle ABC$  approaches  $0^\circ$ , and  $m\angle BCF$  approaches  $180^\circ$ , and  $m\angle CFA$  approaches  $0^\circ$ .
- c.  $65^\circ$ ,  $115^\circ$ ,  $115^\circ$ ; in an isosceles trapezoid base angles are congruent.

- 37.** Since  $\overline{BC} \parallel \overline{AE}$  and  $\overline{AB} \parallel \overline{EC}$ ,  $ABCE$  is a parallelogram which makes  $\overline{AB} \cong \overline{EC}$ . Using the Transitive Property of Segment Congruence,  $\overline{CE} \cong \overline{CD}$  making  $\triangle ECD$  isosceles. Since  $\triangle ECD$  is isosceles  $\angle D \cong \angle CED$ .  $\angle A \cong \angle CED$  using the Corresponding Angles Congruence Postulate, therefore  $\angle A \cong \angle D$  using the Transitive Property of Angle Congruence.  $\angle CED$  and  $\angle CEA$  form a linear pair and therefore are supplementary.  $\angle A$  and  $\angle ABC$  are supplementary, and  $\angle CEA$  and  $\angle ECB$  are supplementary since they are consecutive pairs of angles in a parallelogram. Using the Congruent Supplements Theorem,  $\angle A \cong \angle D$  and  $\angle B \cong \angle BCD$ .
- 38.** Since  $\overline{FG} \parallel \overline{EJ}$  and  $\overline{EF} \parallel \overline{JG}$ ,  $EFGJ$  is a parallelogram. Using the Corresponding Angles Theorem,  $\angle E \cong \angle GJH$ . It was given that  $\angle E \cong \angle H$ , therefore  $\angle GJH \cong \angle H$  using the Transitive Property of Congruence. By the Converse of the Base Angles Theorem,  $\triangle GHJ$  is isosceles with  $\overline{JG} \cong \overline{HG}$ . Since  $EFGH$  is a parallelogram,  $\overline{JG} \cong \overline{EF}$ . Using the Transitive
- Property of Congruence,  $\overline{EF} \cong \overline{HG}$ . This makes  $EFGJ$  an isosceles trapezoid.
- 39.** Given:  $JKLM$  is an isosceles trapezoid with  $\overline{KL} \parallel \overline{JM}$  and  $\overline{JK} \cong \overline{LM}$ . Since pairs of base angles are congruent in an isosceles trapezoid,  $\angle JKL \cong \angle MLK$ . Using the Reflexive Property of Congruence,  $\overline{KL} \cong \overline{KL}$ .  $\triangle JKL \cong \triangle MLK$  using the SAS Congruence Postulate. Using corresponding parts of congruent triangles are congruent,  $\overline{JL} \cong \overline{KM}$ .
- 40.** In a triangle the midsegment's length is half the length of the third side, therefore  $BG = \frac{1}{2} CD$  and  $GE = \frac{1}{2} AF$ . This implies that  $BG + GE = \frac{1}{2} CD + \frac{1}{2} AF$ , which implies  $BE = \frac{CD + AF}{2}$ .

- 41.** Given:  $ABCD$  is a kite with  $\overline{AB} \cong \overline{CB}$  and  $\overline{AD} \cong \overline{CD}$ .  
Using the Reflexive Property of Congruence,  $\overline{BD} \cong \overline{BD}$  and  $\overline{ED} \cong \overline{ED}$ . Using the SSS Congruence Postulate,  $\triangle BAD \cong \triangle BCD$ . Using corresponding parts of congruent triangles are congruent,  $\angle CDE \cong \angle ADE$ . Using the SAS Congruence Postulate,  $\triangle CDE \cong \triangle ADE$ . Using corresponding parts of congruent triangles are congruent,  $\angle CED \cong \angle AED$ . Since  $\angle CED$  and  $\angle AED$  are congruent and form a linear pair, they are right angles. This makes  $\overline{AC} \perp \overline{BD}$ .

- 42.** Given:  $EFGH$  is a kite with  $\overline{EF} \cong \overline{GF}$  and  $\overline{EH} \cong \overline{GH}$ .  
Construct  $\overline{FH}$ . Using the Reflexive Property of Congruence,  $\overline{FH} \cong \overline{FH}$ . Using the SSS Congruence Postulate,  $\triangle FGH \cong \triangle FEH$ . Using corresponding parts of congruent triangles are congruent,  $\angle G \cong \angle E$ . Now suppose  $\angle F \cong \angle H$ . This would make  $EFGH$  a parallelogram and  $EFGH$  would not be a kite. This contradicts the given, thus  $\angle F$  is not congruent to  $\angle H$ .

- 43.** If the diagonals of a trapezoid are congruent, then the trapezoid is isosceles. Given: trapezoid  $JKLM$  with  $\overline{KM} \cong \overline{JL}$ . Draw  $\overline{KP}$  perpendicular to  $\overline{JM}$  at point  $P$  and draw  $\overline{LQ}$  perpendicular to  $\overline{JM}$  at point  $Q$ .  $KLQP$  is a rectangle with  $\overline{KP} \cong \overline{LQ}$ . Since  $\triangle LQJ$  and  $\triangle KPM$  are right triangles, they are congruent by the HL Congruence Theorem. Using corresponding parts of congruent triangles are congruent,  $\angle LJM \cong \angle KMJ$ . Using the Reflexive Property of Congruence,  $\overline{JM} \cong \overline{JM}$ .  $\triangle LJM \cong \triangle KMJ$  by the SAS Congruence Postulate. Using corresponding parts of congruent triangles are congruent,  $\overline{KJ} \cong \overline{LM}$ . Trapezoid  $JKLM$  is isosceles.
